Chapter 10 Segmentation

Tópicos Especiais em Visão Computacional

Chapter 10 Segmentation

- A segmentação subdivide uma imagem em regiões ou objetos que a compõem:
 - O nível de detalhe depende do problema;
 - Segmentação finaliza quando objetos de interesse ao problema são detectados.
- A separação dos pixels relativos a cada objeto, ou região, é uma etapa fundamental para o sucesso do processo de análise da imagem;
- Embora o ser humano possa facilmente identificar regiões com as mesmas características ou objetos em uma imagem, em um computador essa tarefa pode ser complexa.

FIGURE 10.1 (a) Image containing a region of constant intensity. (b) Image showing the boundary of the inner region, obtained from intensity discontinuities. (c) Result of segmenting the image into two regions. (d) Image containing a textured region. (e) Result of edge computations. Note the large number of small edges that are connected to the original boundary, making it difficult to find a unique boundary using only edge information. (f) Result of segmentation based on region properties.

Chapter 10 Segmentation

- O processo de agrupamento dos pixels pertencentes a um mesmo objeto ou região é chamado de segmentação;
- As técnicas de segmentação de imagens podem ser classificadas nas seguintes categorias:
 - Detecção de descontinuidades;
 - Técnicas de limiar;
 - Métodos baseados em agrupamento;
 - **Métodos em crescimento de região;**
 - **Redes Neurais Convolucionais.**

Chapter 10
Segmentation

Detecção de descontinuidades

- Levam em consideração o fato de que entre duas regiões deve existir uma fronteira;
- Procura-se identificar descontinuidades que possam representar as bordas da região;
- A operação clássica: **gradiente**
 - intensifica variações de tonalidade resultando em uma imagem com pixels mais intensos;
- Problema na aplicação do gradiente:
 - Obtenção de regiões com bordas abertas devido a ruídos ou uso de iluminação não uniforme no processo de aquisição da imagem

Chapter 10 Segmentation

Gradiente de uma Imagem

- Derivadas de uma função digital são definidas por diferenças; Tais aproximações devem considerar que a derivada deve ser:
 - zero em áreas de intensidade constante;
 - zero no início de um degrau ou rampa de intensidade;
 - diferente de zero ao longo de uma rampa de intensidade.
- A derivada de primeira ordem de uma função $f(x)$ é obtida da seguinte forma:

$$\frac{\delta f}{\delta x} = f'(x) = f(x + 1) - f(x).$$

The image strip corresponds to the intensity profile, and the numbers in the boxes are the intensity values of the dots shown in the profile. The derivatives were obtained using Eqs. (10.2-1) and (10.2-2).

Chapter 10 Segmentation

Três passos fundamentais devem ser considerados:

- Suavização da imagem para redução de ruído;
- Detecção dos pontos de borda;
- Localização da borda;

FIGURE 10.11 First column: Images and intensity profiles of a ramp edge corrupted by random Gaussian noise of zero mean and standard deviations of 0.0, 0.1, 1.0, and 10.0 intensity levels, respectively. Second column: First-derivative images and intensity profiles. Third column: Second-derivative images and intensity profiles.

Chapter 10 Segmentation

Limiariação

- Características:
 - propriedades intuitivas;
 - simplicidade de implementação;
 - desempenho computacional.
- As bases da limiarização de intensidade:
 - Suponha objetos claros em um fundo escuro. Uma maneira de separá-los, seria gerar uma imagem segmentada, baseada na análise do histograma da imagem original, onde:

$$g(x, y) = \begin{cases} 1 & \text{se } f(x, y) > T \\ 0 & \text{se } f(x, y) \leq T \end{cases}$$

Chapter 10
Segmentation

Método baseado em agrupamento: K-means

- Técnica de agrupamento de regiões;
- Conjunto de dados → classes disjuntas;
- *K-means*: particionar n objetos em K agrupamentos;
- Características:
 - possibilidade de trabalhar com grandes bases de dados;
 - baixo custo computacional
 - mudança de pertinência durante o processo;
 - **classe**: representada por um centro (ponto);
 - número de classes iniciais pode impor estrutura errônea;
 - Implementação disponível no *skimage*.
